Geothermal Heating and Cooling Solutions for the 21st Century

Young Plumbing and Heating saves you money by offering the newest, most advanced Geothermal Heating and Cooling technology available today:

- Older furnaces waste 35 to 40 cents of every heating dollar you spend.
- With new advances in energy efficient technology, even your 10-year-old air conditioner *is costing you 20 to 40 percent more to cool your house* than a new unit will.
- A new system could bring you a 12 percent or higher return on your investment. At that rate, *you'd pay yourself back in energy savings in less than five years!*

It's easy to see why Geothermal Heating and Cooling is the system of choice for residential, commercial, industrial, and government buildings.

Geothermal Systems provide:

- **Comfort** – geothermal heating and cooling systems maintain even temperatures year round and give increased dehumidification in cooling mode.
- **Safe and Clean Operation** – no flame ... no flue ... no odors ... no danger of fire or fumes.
- **Reliability** – geothermal units contain few moving parts so they last longer and operate efficiently for years with little maintenance.
- **Flexibility** – you could get heating, central air conditioning, and domestic hot water from the same compact unit.
- **Savings** – up to 60% over conventional systems!
Depending on usage, weather, and local utility rates, you could save in the range of \$600 to \$1,200 annually.

To start saving money on your heating and cooling bills now, call Young Plumbing and Heating (319) 234-4411 *today* for more information and a free consultation.
